

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

September 22, 2024

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

In the version 4.0, the syntax of the absolute and relative paths used in `\PitonInputFile` has been changed: cf. part 6.1, p. 10.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape` (except when the key `write` is used). The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages `listings` and `minted`.

The name of this extension (`piton`) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 4.0 of **piton**, at the date of 2024/09/22.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by `#>`.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`³;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the languages supported natively by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language: \PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset informatic codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.
- The command `\PitonInputFile` is used to insert and typeset an external file: cf. 6.1 p. 10.

³That language `minimal` may be used to format pseudo-codes: cf. p. 31

3.4 The syntax of the command \piton

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- [Syntax `\piton{...}`](#)

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands⁴ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectionation }
\piton{c="#"      \\ \\ # an affectionation }
\piton{MyDict = {'a': 3, 'b': 4 }}

MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectionation
c="#"      # an affectionation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁵

However, since the argument is expanded (in the TeX sens), one should take care not using in its argument *fragile* commands (that is to say commands which are neither *protected* nor *fully expandable*).

- [Syntax `\piton|...|`](#)

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectionation +
\piton?MyDict = {'a': 3, 'b': 4}?

MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectionation
MyDict = {'a': 3, 'b': 4}
```

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt`.

⁴That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁵For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

4.1 The keys of the command \PitonOptions

The command `\PitonOptions` takes in argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁶

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the five built-in languages (Python, OCaml, C, SQL and `minimal`) or the name of the language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 9).

The initial value is `Python`.

- **New 4.0**

The key `font-command` contains instructions of font which will be inserted at the beginning of all the elements composed by `piton`.

The initial value is `\ttfamily` and, thus, `piton` uses by default the current monospaced font.

- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁷ of the current environment in that file. At the first use of a file by `piton`, it is erased.

This key requires a compilation with `lualatex -shell-escape`.

- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁸
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁹
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.1.2, p. 11). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.

⁶We remind that a LaTeX environment is, in particular, a TeX group.

⁷In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 23).

⁸For the language Python, the empty lines in the docstrings are taken into account (by design).

⁹When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is `0.7 em`.
- The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em ,
        line-format = \footnotesize \color{blue}
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part [8.1](#) on page [23](#).

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, piton adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. [6.2.1](#), p. [13](#)).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX¹⁰.

For an example of use of `width=min`, see the section [8.2](#), p. [24](#).

¹⁰The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latexm` (used by Overleaf) do automatically a sufficient number of compilations.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹¹ are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹²

Example : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹³ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton`. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C, line-numbers, auto-gobble, background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 13).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are

¹¹With the language Python that feature applies only to the short strings (delimited by '`'` or '`"`). In OCaml, that feature does not apply to the *quoted strings*.

¹²The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

¹³cf. 6.2.1 p. 13

limited to the current TeX group.¹⁴

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luatex` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!30] }
```

In that example, `\highLight[red!30]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!30]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by piton in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 27.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁵

For example, with the command

```
\SetPitonStyle[SQL]{Keyword = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).¹⁶

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

¹⁴We remind that a LaTeX environment is, in particular, a TeX group.

¹⁵We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹⁶As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

4.2.3 The style UserFunction

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color [HTML] {CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}
\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for in in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹⁷

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁸

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{0}{\PitonOptions{#1}}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
  {\begin{tcolorbox}}
  {\end{tcolorbox}}
```

¹⁷We remind that, in `piton`, the name of the informatic languages are case-insensitive.

¹⁸However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

With this new environment {Python}, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

5 Definition of new languages with the syntax of listings

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `lstlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto,if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
} [keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto,if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
}
```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁹

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `@` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

6 Advanced features

6.1 Insertion of a file

6.1.1 The command `\PitonInputFile`

The command `\PitonInputFile` includes the content of the file specified in argument (or only a part of that file: see below). The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters `T` and `F`. Those arguments will be executed if the file to include has been found (letter `T`) or not found (letter `F`).

¹⁹We recall that, for piton, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

Modification 4.0

The syntax for the absolute and relative paths has been changed in order to be conform to the traditionnal usages. However, it's possible to use the key `old-PitonInputFile` at load-time (that is to say with the `\usepackage`) in order to have the old behaviour (though, that key will be deleted in a future version of `piton!`).

Now, the syntax if the following one:

- The paths beginning by / are absolute.

Example : \PitonInputFile{/Users/joe/Documents/program.py}

- The paths which do not begin with / are relative to the current repertory.

Example : \PitonInputFile{my_listings/program.py}

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

As previously, the absolute paths must begin with /.

6.1.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
# [Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

6.2 Page breaks and line breaks

6.2.1 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return (on the condition that the used font is a monospaced font and this is the case by default since the initial value of `font-command` is `\ttfamily`).
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\; (the command \; inserts a small horizontal space).`
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `\hookrightarrow`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+     ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
        our_dict[name] = [treat_Postscript_line(k) for k in \
+         ↪ list_letter[1:-1]]
    return dict
```

6.2.2 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, `piton` provides the keys `splittable-on-empty-lines` and `splittable` to allow such breaks.

- The key `splittable-on-empty-lines` allows breaks on the empty lines. The “empty lines” are in fact the lines which contains only spaces.

- Of course, the key `splittable-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines.²⁰

For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²¹

6.3 Splitting of a listing in sub-listings

The extension `piton` provides the key `split-on-empty-lines`, which should not be confused with the key `splittable-on-empty-lines` previously defined.

In order to understand the behaviour of the key `split-on-empty-lines`, one should imagine that he has to compose an informatic listing which contains several definitions of informatic functions. Usually, in the informatic languages, those definitions of functions are separated by empty lines.

The key `split-on-empty-lines` splits the listings on the empty lines. Several empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it's possible to put the TeX primitive `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.

New 4.0

Each chunk of the informatic listing is composed in an environment whose name is given by the key `env-used-by-split`. The initial value of that parameter is, not surprisingly, `Piton` and, hence, the different chunks are composed in several environments `{Piton}`. If one decides to change the value of `env-used-by-split`, he should use the name of an environment created by `\NewPitonEnvironment` (cf. part 4.3, p. 8).

Each chunk of the informatic listing is formated in its own environment. Therefore, it has its own line numbering (if the key `line-numbers` is in force) and its own colored background (when the key `background-color` is in force), separated from the background color of the other chunks. When used, the key `splittable` applies in each chunk (independently of the other chunks). Of course, a page break may occur between the chunks of code, regardless of the value of `splittable`.

```
\begin{Piton}[split-on-empty-lines,background-color=gray!15,line-numbers]
def square(x):
    """Computes the square of x"""
    return x*x

def cube(x):
```

²⁰Remark that we speak of the lines of the original informatic listing and such line may be composed on several lines in the final PDF when the key `break-lines-in-Piton` is in force.

²¹With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```

    """Calcule the cube of x"""
    return x*x*x
\end{Piton}

```

```

1 def square(x):
2     """Computes the square of x"""
3     return x*x

```

```

1 def cube(x):
2     """Calcule the cube of x"""
3     return x*x*x

```

Caution: Since each chunk is treated independently of the others, the commands specified by `\detected-commands` and the commands and environments of Beamer automatically detected by `piton` must not cross the empty lines of the original listing.

6.4 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.²²
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf. 4.2 p. 6).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```

\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

²²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

6.5 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.6 p. 19.

6.5.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
the LaTeX comments will begin by #LaTeX.
```

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the `piton` style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 24

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.²³

6.5.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.5.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).

In the following example, which is a recursive programmation of the factorial function, we decide to highlight the recursive call. The command `\highLight` of `lua-ul`²⁴ directly does the job with the easy syntax `\highLight{...}`.

We assume that the preamble of the LaTeX document contains the following line:

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}
```

²³That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

²⁴The package `lua-ul` requires itself the package `luacolor`.

```

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

6.5.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, piton does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `lua-ul`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!, end-escape=!}
```

Then, it's possible to write:

```

\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.5.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```
\PitonOptions{begin-escape-math=$, end-escape-math=$}
```

Remark that the character \$ must *not* be protected by a backslash.

However, it's probably more prudent to use \(` et \)`.

```
\PitonOptions{begin-escape-math=\(`,end-escape-math=\)`}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(` < 0`\) :
        return \(`-\arctan(-x)`\)
    elif \(` > 1`\) :
        return \(`(\pi/2 - \arctan(1/x))`\)
    else:
        s = \(`0`\)
        for \(`k`\) in range(\(`n`\)): s += \(`\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}`\)
    return s
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

6.6 Behaviour in the class Beamer

First remark

Since the environment {Piton} catches its body with a verbatim mode, it's necessary to use the environments {Piton} within environments {frame} of Beamer protected by the key `fragile`, i.e. beginning with \begin{frame}[fragile].²⁵

When the package piton is used within the class beamer²⁶, the behaviour of piton is slightly modified, as described now.

6.6.1 {Piton} et \PitonInputFile are “overlay-aware”

When piton is used in the class beamer, the environment {Piton} and the command \PitonInputFile accept the optional argument <...> of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

²⁵Remind that for an environment {frame} of Beamer using the key `fragile`, the instruction \end{frame} must be alone on a single line (except for any leading whitespace).

²⁶The extension piton detects the class beamer and the package beamerarticle if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by piton at load-time: \usepackage[beamer]{piton}

6.6.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause27` ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ; It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁸ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "`{`" and "`}`" are correctly interpreted (without any escape character).

6.6.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When piton is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleref}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

²⁷One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁸The short strings of Python are the strings delimited by characters '`'` or the characters "`"` and not '`'''` nor '`"""`'. In Python, the short strings can't extend on several lines.

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
    return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}
```

Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```
\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
{\renewenvironment{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother
```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

6.7 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it’s also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.5.3, p. 17).

In this document, the package `piton` has been loaded with the option `footnotehyper` dans we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}

\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)29
    elif x > 1:
        return pi/2 - arctan(1/x)30
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can’t be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emph{\begin{minipage}{\linewidth}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

²⁹First recursive call.

³⁰Second recursive call.

6.8 Tabulations

Even though it's probably recommended to indent the informatics listings with spaces and not tabulations³¹, piton accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of piton (in lower case).

The extension piton provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of piton.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.5.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.5.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.4, p. 25.

8 Examples

8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by piton in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)      #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
```

³¹For the language Python, see the note PEP 8

```

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```

\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)      #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```

\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:

```

```

s = 0
for k in range(n):
    s += (-1)**k/(2*k+1)*x***(2*k+1)
return s

```

8.3 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. That tuning uses the command `\highLight` of `lua-ul` (that package requires itself the package `luacolor`).

```

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}

```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in piton is *not* empty.

```

from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s

```

8.4 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `\PitonExecute` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```
\NewPitonEnvironment{\PitonExecute}{!O{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}}
\ignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 23.

This environment `\PitonExecute` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.³²

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }) ; that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }) ; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>in</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .
<code>Identifier</code>	the identifiers.

³²See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with `\PitonOptions{language = OCaml}`.

It's also possible to set the language OCaml for an individual environment `{Piton}`.

```
\begin{Piton} [language=OCaml]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=OCaml]{...}`

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, done, downto, do, else, exception, for, function , fun, if, lazy, match, mutable, new, of, private, raise, then, to, try , virtual, when, while and with
Keyword.Governing	the following keywords: and, begin, class, constraint, end, external, functor, include, inherit, initializer, in, let, method, module, object, open, rec, sig, struct, type and val.
Identifier	the identifiers.

9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while
Identifier	the identifiers.

9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Identifier</code>	the identifiers.

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.4, p. 15) in order to create, for example, a language for pseudo-code.

9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defines by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)
<code>Identifier</code>	the identifiers.

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³³

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{ " }}b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}}"
{ luatexbase.catcodetables.CatcodeTableOther, " "
{ "{\PitonStyle{Name.Function}{ " }
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}}"
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }

{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - _@@_end_line:`. The token `_@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `_@@_begin_line:`. Both tokens `_@@_begin_line:` and `_@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a piton style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³³Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```

```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
24 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
25 {
26   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
27     { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
28     { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
29 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
30 \cs_new_protected:Npn \@@_error_or_warning:n
31   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use \c_sys_jobname_str because, with Overleaf, the value of \c_sys_jobname_str is always “output”.

146   piton.last_code = ''
147   piton.last_language = ''
148 }

```

10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

149 \str_new:N \l_piton_language_str
150 \str_set:Nn \l_piton_language_str { python }

```

Each time an environment of `piton` is used, the informatic code in the body of that environment will be stored in the following global string.

```
151 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
152 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
153 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

154 \bool_new:N \l_@@_in_PitonOptions_bool
155 \bool_new:N \l_@@_in_PitonInputFile_bool

```

The following parameter corresponds to the key `font-command`.

```

156 \tl_new:N \l_@@_font_command_tl
157 \tl_set:Nn \l_@@_font_command_tl { \ttfamily }

```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
158 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
159 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

```
160 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation). The technic of the auxiliary file will be used when the key `width` is used with the value `min`.

```
161 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```
162 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
163 \int_set:Nn \l_@@_splittable_int { 100 }
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
164 \tl_new:N \l_@@_split_separation_tl  
165 \tl_set:Nn \l_@@_split_separation_tl  
166 { \vspace { \baselineskip } \vspace { -1.25pt } }
```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
167 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
168 \tl_new:N \l_@@_prompt_bg_color_t1
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
169 \str_new:N \l_@@_begin_range_str  
170 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
171 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
172 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
173 \str_new:N \l_@@_write_str  
174 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
175 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
176 \bool_new:N \l_@@_break_lines_in_Piton_bool  
177 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
178 \tl_new:N \l_@@_continuation_symbol_tl  
179 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
180 \tl_new:N \l_@@_csoi_tl  
181 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
182 \tl_new:N \l_@@_end_of_broken_line_tl  
183 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
184 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `\Piton` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the `aux` file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```
185 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
186 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```
187 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `\Piton` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```
188 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
189 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
190 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
191 \dim_new:N \l_@@_numbers_sep_dim  
192 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```

193 \seq_new:N \g_@@_languages_seq

194 \int_new:N \l_@@_tab_size_int
195 \int_set:Nn \l_@@_tab_size_int { 4 }

196 \cs_new_protected:Npn \@@_tab:
{
  \bool_if:NTF \l_@@_show_spaces_bool

    \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
    \(\ \mathcolor{gray}
      { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)
  }
  { \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } } }
  \int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int
}

```

The following integer corresponds to the key `gobble`.

```
209 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```

210 \tl_new:N \l_@@_space_tl
211 \tl_set_eq:NN \l_@@_space_tl \nobreakspace

```

At each line, the following counter will count the spaces at the beginning.

```
212 \int_new:N \g_@@_indentation_int
```

Be careful: when executed, the following command does *not* create a space (only an incrementation of the counter).

```

213 \cs_new_protected:Npn \@@_leading_space:
214   { \int_gincr:N \g_@@_indentation_int }

```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

215 \cs_new_protected:Npn \@@_label:n #
216 {
  \bool_if:NTF \l_@@_line_numbers_bool
  {
    \@bsphack
    \protected@write \auxout { }
    {
      \string \newlabel { #1 }
    }
  }
}

```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

224   { \int_eval:n { \g_@@_visual_line_int + 1 } }
225   { \thepage }
226   }
227   }
228   \@esphack
229 }
{ \@@_error:n { label-with-lines-numbers } }
}

```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
232 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
233 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:... \@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
234 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
235 \cs_new_protected:Npn \@@_prompt:
236 {
237     \tl_gset:Nn \g_@@_begin_line_hook_tl
238     {
239         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
240         { \clist_set:No \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
241     }
242 }
```

The spaces at the end of a line of code are deleted by `piton`. However, it’s not actually true: they are replace by `\@@_trailing_space:`.

```
243 \cs_new_protected:Npn \@@_trailing_space: { }
```

When we have to rescan some pieces of code with `\@@_piton:n`, we will set `\@@_trailing_space:` equal to `\space`.

10.2.3 Treatment of a line of code

```
244 \cs_new_protected:Npn \@@_replace_spaces:n #1
245 {
246     \tl_set:Nn \l_tmpa_tl { #1 }
247     \bool_if:NTF \l_@@_show_spaces_bool
248     {
249         \tl_set:Nn \l_@@_space_t1 { \ } % U+2423
250         \regex_replace_all:nnN { \x20 } { \ } \l_tmpa_tl
251     }
252 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
253     \bool_if:NT \l_@@_break_lines_in_Piton_bool
254     {
255         \regex_replace_all:nnN
256         { \x20 }
257         { \c { @@_breakable_space: } }
258         \l_tmpa_t1
259         \regex_replace_all:nnN
260         { \c { l_@@_space_t1 } }
261         { \c { @@_breakable_space: } }
262         \l_tmpa_t1
263     }
264 }
265 \l_tmpa_t1
266 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line::`.

`\@@_begin_line:` is a TeX command with a delimited argument (`\@@_end_line:` is the marker for the end of the argument).

However, we define also `\@@_end_line:` as no-op, because, when the last line of the listing is the end of an environment of Beamer (eg `\end{uncoverenv}`), we will have a token `\@@_end_line:` added at the end without any corresponding `\@@_begin_line::`).

```
267 \cs_set_protected:Npn \@@_end_line: { }
```

```
268 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
269 {
270     \group_begin:
271     \g_@@_begin_line_hook_tl
272     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```
273 \bool_if:NTF \l_@@_width_min_bool
274     \@@_put_in_coffin_i:i:n
275     \@@_put_in_coffin_i:n
276 {
277     \language = -1
278     \raggedright
279     \strut
280     \@@_replace_spaces:n { #1 }
281     \strut \hfil
282 }
```

Now, we add the potential number of line, the potential left margin and the potential background.

```
283 \hbox_set:Nn \l_tmpa_box
284 {
285     \skip_horizontal:N \l_@@_left_margin_dim
286     \bool_if:NT \l_@@_line_numbers_bool
287     {
```

`\l_tmpa_int` will be true equal to 1 when the current line is not empty.

```
288 \int_set:Nn \l_tmpa_int
289 {
290     \lua_now:e
291     {
292         tex.sprint
293         (
294             luatexbase.catcodetables.expl ,
295             tostring
296             ( piton.empty_lines
297                 [ \int_eval:n { \g_@@_line_int + 1 } ]
298             )
299         )
300     }
301 }
302 \bool_lazy_or:nnT
303     { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
304     { ! \l_@@_skip_empty_lines_bool }
305     { \int_gincr:N \g_@@_visual_line_int }
306 \bool_if:nT
307     {
308         \int_compare_p:nNn \l_tmpa_int = \c_one_int
309         ||
310         ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
311     }
312 \@@_print_number:
313 }
```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

314     \clist_if_empty:NF \l_@@_bg_color_clist
315     {
316         \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
317             { \skip_horizontal:n { 0.5 em } }
318         }
319         \coffin_typeset:Nnnnn \l_tmpa_coffin T l \c_zero_dim \c_zero_dim
320     }
321     \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
322     \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }

```

We have to explicitly begin a paragraph because we will insert a TeX box (and we don't want that box to be inserted in the vertical list).

```

323     \mode_leave_vertical:
324     \clist_if_empty:NTF \l_@@_bg_color_clist
325         { \box_use_drop:N \l_tmpa_box }
326         {
327             \vtop
328             {
329                 \hbox:n
330                 {
331                     \c_@@_color:N \l_@@_bg_color_clist
332                     \vrule height \box_ht:N \l_tmpa_box
333                         depth \box_dp:N \l_tmpa_box
334                         width \l_@@_width_dim
335                 }
336                 \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
337                 \box_use_drop:N \l_tmpa_box
338             }
339         }
340     \group_end:
341     \tl_gclear:N \g_@@_begin_line_hook_tl
342 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That command takes in its argument by curryfication.

```

343 \cs_set_protected:Npn \c_@@_put_in_coffin_i:n
344     { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }

```

The second case is the case when the key `width` is used with the special value `min`.

```

345 \cs_set_protected:Npn \c_@@_put_in_coffin_i:n #1
346 {

```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```

347     \hbox_set:Nn \l_tmpa_box { #1 }

```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```

348 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
349     { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
350     \hcoffin_set:Nn \l_tmpa_coffin
351     {
352         \hbox_to_wd:nn \l_@@_line_width_dim

```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 24).

```

353     { \hbox_unpack:N \l_tmpa_box \hfil }
354 }
355 }

```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

356 \cs_set_protected:Npn \@@_color:N #1
357 {
358   \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
359   \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
360   \tl_set:Ne \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
361   \tl_if_eq:NnTF \l_tmpa_tl { none }

```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

362   { \dim_zero:N \l_@@_width_dim }
363   { \exp_args:No \@@_color_i:n \l_tmpa_tl }
364 }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

365 \cs_set_protected:Npn \@@_color_i:n #1
366 {
367   \tl_if_head_eq_meaning:nNTF { #1 } [
368     {
369       \tl_set:Nn \l_tmpa_tl { #1 }
370       \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
371       \exp_last_unbraced:No \color \l_tmpa_tl
372     }
373     { \color { #1 } }
374 }

```

The command `\@@_newline:` will be inserted by Lua between two lines of the informative listing.

- In fact, it will be inserted between two commands `\@@_begin_line:... \@@_end_of_line:..`
- When the key `break-lines-in-Piton` is in force, a line of the informative code (the *input*) may result in several lines in the PDF (the *output*).
- Remind that `\@@_newline:` has a rather complex behaviour because it will finish and start paragraphs.

```

375 \cs_new_protected:Npn \@@_newline:
376 {
377   \bool_if:NT \g_@@_footnote_bool \endsavenotes

```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```
378   \int_gincr:N \g_@@_line_int
```

... it will be used to allow or disallow page breaks.

Each line in the listing is composed in a box of TeX (which may contain several lines when the key `break-lines-in-Piton` is in force) put in a paragraph.

```
379   \par
```

We now add a `\kern` because each line of code is overlapping vertically by a quantity of 2.5 pt in order to have a good background (when `background-color` is in force). We need to use a `\kern` (in fact `\par\kern...`) and not a `\vskip` because page breaks should *not* be allowed on that kern.

```
380   \kern -2.5 pt
```

Now, we control page breaks after the paragraph. We use the Lua table `piton.lines_status` which has been written by `piton.ComputeLinesStatus` for this aim. Each line has a “status” (equal to 0, 1 or 2) and that status directly says whether a break is allowed.

```

381   \int_case:nn
382   {
383     \lua_now:e
384     {
385       \tex.sprint
386       (

```

```

387         luatexbase.catcodetables.expl ,
388         tostring ( piton.lines_status [ \int_use:N \g_@@_line_int ] )
389     )
390   }
391 {
392   { 1 { \penalty 100 } 2 \nobreak }
393   \bool_if:NT \g_@@_footnote_bool \savenotes
394 }

```

After the command `\@@_newline:`, we will usually have a command `\@@_begin_line::`.

```

395 \cs_set_protected:Npn \@@_breakable_space:
396 {
397   \discretionary
398     { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }
399   {
400     \hbox_overlap_left:n
401     {
402       {
403         \normalfont \footnotesize \color { gray }
404         \l_@@_continuation_symbol_tl
405       }
406       \skip_horizontal:n { 0.3 em }
407       \clist_if_empty:NF \l_@@_bg_color_clist
408         { \skip_horizontal:n { 0.5 em } }
409     }
410   \bool_if:NT \l_@@_indent_broken_lines_bool
411   {

672 }

673 \cs_new_protected:Npn \@@_in_PitonInputFile:n #1
674 {
675   \bool_if:NTF \l_@@_in_PitonInputFile_bool
676   { #1 }
677   { \@@_error:n { Invalid~key } }
678 }

```

```

679 \NewDocumentCommand \PitonOptions { m }
680 {
681   \bool_set_true:N \l_@@_in_PitonOptions_bool
682   \keys_set:nn { PitonOptions } { #1 }
683   \bool_set_false:N \l_@@_in_PitonOptions_bool
684 }
```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

685 \NewDocumentCommand \@@_fake_PitonOptions { }
686   { \keys_set:nn { PitonOptions } }
```

10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

687 \int_new:N \g_@@_visual_line_int
688 \cs_new_protected:Npn \@@_incr_visual_line:
689 {
690   \bool_if:NF \l_@@_skip_empty_lines_bool
691   { \int_gincr:N \g_@@_visual_line_int }
692 }
693 \cs_new_protected:Npn \@@_print_number:
694 {
695   \hbox_overlap_left:n
696   {
697     \l_@@_line_numbers_format_tl
698 }
```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

699   { \int_to_arabic:n \g_@@_visual_line_int }
700 }
701 \skip_horizontal:N \l_@@_numbers_sep_dim
702 }
703 }
```

10.2.6 The command to write on the aux file

```

704 \cs_new_protected:Npn \@@_write_aux:
705 {
706   \tl_if_empty:NF \g_@@_aux_tl
707   {
708     \iow_now:Nn \omainaux { \ExplSyntaxOn }
709     \iow_now:Ne \omainaux
710     {
711       \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
712       { \exp_not:o \g_@@_aux_tl }
713     }
714     \iow_now:Nn \omainaux { \ExplSyntaxOff }
715   }
716   \tl_gclear:N \g_@@_aux_tl
717 }
```

The following macro will be used only when the key `width` is used with the special value `min`.

```

718 \cs_new_protected:Npn \@@_width_to_aux:
719 {
```

```

720   \tl_gput_right:Nn \g_@@_aux_tl
721   {
722     \dim_set:Nn \l_@@_line_width_dim
723     { \dim_eval:n { \g_@@_tmp_width_dim } }
724   }
725 }
```

10.2.7 The main commands and environments for the final user

```

726 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
727 {
728   \tl_if_no_value:nTF { #3 }
```

The last argument is provided by currying.

```
729   { \@@_NewPitonLanguage:n { #1 } { #2 } }
```

The two last arguments are provided by currying.

```
730   { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
731 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```
732 \prop_new:N \g_@@_languages_prop
```

```

733 \keys_define:nn { NewPitonLanguage }
734 {
735   morekeywords .code:n = ,
736   otherkeywords .code:n = ,
737   sensitive .code:n = ,
738   keywordsprefix .code:n = ,
739   moretexcs .code:n = ,
740   morestring .code:n = ,
741   morecomment .code:n = ,
742   moredelim .code:n = ,
743   moredirectives .code:n = ,
744   tag .code:n = ,
745   alsodigit .code:n = ,
746   alsoletter .code:n = ,
747   alsoother .code:n = ,
748   unknown .code:n = \@@_error:n { Unknown-key~NewPitonLanguage }
749 }
```

The function `\@@_NewPitonLanguage:n` will be used when the language is *not* defined above a base language (and a base dialect).

```
750 \cs_new_protected:Npn \@@_NewPitonLanguage:n { #1 } { #2 } { #3 }
751 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```

752   \tl_set:Nn \l_tmpa_tl
753   {
754     \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
755     \str_lowercase:n { #2 }
756   }
```

The following set of keys is only used to raise an error when a key is unknown!

```
757 \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```
758 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```

759   \exp_args:No \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
760 }
761 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
762 {
763   \hook_gput_code:nnn { begindocument } { . }
764   { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
765 }
```

Now the case when the language is defined upon a base language.

```

766 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
767 {
```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{C}{...}`

```

768 \tl_set:Ne \l_tmpa_tl
769 {
770   \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
771   \str_lowercase:n { #4 }
772 }
```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```
773 \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl
```

We can now define the new language by using the previous function.

```

774 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
775 { \@@_error:n { Language-not-defined } }
776 }
```

```
777 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

778 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
779 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }

780 \NewDocumentCommand { \piton } { }
781   { \peek_meaning:NTF \bgroup \@@_piton_standard \@@_piton_verbatim }
782 \NewDocumentCommand { \@@_piton_standard } { m }
783 {
784   \group_begin:
```

The following tuning of LuaTeX in order to avoid all break of lines on the hyphens.

```
785 \automatichyphenmode = 1
```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Ne` below) and that's why we can provide the following escapes to the final user:

```

786 \cs_set_eq:NN \\ \c_backslash_str
787 \cs_set_eq:NN \% \c_percent_str
788 \cs_set_eq:NN \{ \c_left_brace_str
789 \cs_set_eq:NN \} \c_right_brace_str
790 \cs_set_eq:NN \$ \c_dollar_str
```

The standard command `_` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

791 \cs_set_eq:cN { ~ } \space
792 \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
793 \tl_set:Ne \l_tmpa_tl
794 {
795   \lua_now:e
```

```

796     { piton.ParseBis('\l_piton_language_str',token.scan_string()) }
797     { #1 }
798   }
799 \bool_if:NTF \l_@@_show_spaces_bool
800   { \regex_replace_all:nnN { \x20 } { \u } \l_tmpa_tl } % U+2423

```

The following code replaces the characters U+0020 (spaces) by characters U+0020 of catcode 10: thus, they become breakable by an end of line. Maybe, this programmation is not very efficient but the key `break-lines-in-piton` will be rarely used.

```

801   {
802     \bool_if:NT \l_@@_break_lines_in_piton_bool
803       { \regex_replace_all:nnN { \x20 } { \x20 } \l_tmpa_tl }
804   }

```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```

805 \if_mode_math:
806   \text { \l_@@_font_command_t1 \l_tmpa_t1 }
807 \else:
808   \l_@@_font_command_t1 \l_tmpa_t1
809 \fi:
810 \group_end:
811 }
812 \NewDocumentCommand { \@@_piton_verbatim } { v }
813 {
814   \group_begin:
815   \l_@@_font_command_t1
816   \automatichyphenmode = 1
817   \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
818   \tl_set:Nn \l_tmpa_t1
819   {
820     \lua_now:e
821       { piton.Parse('\l_piton_language_str',token.scan_string()) }
822       { #1 }
823   }
824 \bool_if:NT \l_@@_show_spaces_bool
825   { \regex_replace_all:nnN { \x20 } { \u } \l_tmpa_t1 } % U+2423
826 \l_tmpa_t1
827 \group_end:
828 }

```

The following command is not a user command. It will be used when we will have to “rescan” some chunks of informatic code. For example, it will be the initial value of the Piton style `InitialValues` (the default values of the arguments of a Python function).

```

829 \cs_new_protected:Npn \@@_piton:n #1
830   { \tl_if_blank:nF { #1 } { \@@_piton_i:n { #1 } } }

873             {
874                 \lua_now:n
875                     { \piton.#1(token.scan_argument()) }
876                     { #2 }
877                 \int_to_arabic:n
878                     { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
879             }
880             {
881                 \int_to_arabic:n
882                     { \g_@@_visual_line_int + \l_@@_nb_lines_int }
883             }
884         }
885         \dim_set:Nn \l_@@_left_margin_dim
886         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
887     }
888 }
889 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }
```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```
890 \cs_new_protected:Npn \@@_compute_width:
891 {
892     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
893         {
```

```

894     \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
895     \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```

896         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }

```

If there is a background, we subtract 0.5 em for the margin on the right.

```

897         {
898             \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³⁴ and we use that value. Elsewhere, we use a value of 0.5 em.

```

899         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
900             { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
901             { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
902         }
903     }

```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the aux file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

904     {
905         \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
906         \clist_if_empty:NTF \l_@@_bg_color_clist
907             { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }

```

³⁴If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

Now, the key `write`.

```

934     \str_if_empty:NTF \l_@@_path_write_str
935         { \lua_now:e { piton.write = "\l_@@_write_str" } }
936         {
937             \lua_now:e
938                 { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
939         }
940     \str_if_empty:NTF \l_@@_write_str
941         { \lua_now:n { piton.write = '' } }
942         {
943             \seq_if_in:NoTF \g_@@_write_seq \l_@@_write_str
944                 { \lua_now:n { piton.write_mode = "a" } }
945                 {
946                     \lua_now:n { piton.write_mode = "w" }
947                     \seq_gput_left:No \g_@@_write_seq \l_@@_write_str
948                 }
949             }

```

Now, the main job.

```

950     \bool_if:NTF \l_@@_split_on_empty_lines_bool
951         \@@_retrieve_gobble_split_parse:n
952         \@@_retrieve_gobble_parse:n
953         { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```

954     \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:

```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```

955         \end { #1 }
956         \@@_write_aux:
957     }

```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment`...

```

958     \NewDocumentEnvironment { #1 } { #2 }
959     {
960         \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
961         #3
962         \@@_pre_env:
963         \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
964             { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
965         \group_begin:
966         \tl_map_function:nN
967             { \ \ \ \{ \} \$ \& \^ \_ \% \~ \^\I }
968             \char_set_catcode_other:N
969             \use:c { _@@_collect_ #1 :w }
970         }
971     { #4 }

```

The following code is for technical reasons. We want to change the catcode of `\^\M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^\M` is converted to space).

```

972     \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^\M }
973 }

```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will retrieve the first empty line, gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryingification.

```

974 \cs_new_protected:Npn \@@_retrieve_gobble_parse:n

```

```

975   {
976     \lua_now:e
977     {
978       piton.RetrieveGobbleParse
979       (
980         '\l_piton_language_str' ,
981         \int_use:N \l_@@_gobble_int ,
982         \bool_if:NTF \l_@@_splittable_on_empty_lines_bool
983           { \int_eval:n { - \l_@@_splittable_int } }
984           { \int_use:N \l_@@_splittable_int } ,
985         token.scan_argument ( )
986       )
987     }
988   }

```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```

989 \cs_new_protected:Npn \@@_retrieve_gobble_split_parse:n
990   {
991     \lua_now:e
992     {
993       piton.RetrieveGobbleSplitParse
994       (
995         '\l_piton_language_str' ,
996         \int_use:N \l_@@_gobble_int ,
997         \int_use:N \l_@@_splittable_int ,
998         token.scan_argument ( )
999       )
1000     }
1001   }

```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

1002 \bool_if:NTF \g_@@_beamer_bool
1003   {
1004     \NewPitonEnvironment { Piton } { d < > 0 { } }
1005     {
1006       \keys_set:nn { PitonOptions } { #2 }
1007       \tl_if_novalue:nTF { #1 }
1008         { \begin { uncoverenv } }
1009         { \begin { uncoverenv } < #1 > }
1010     }
1011     { \end { uncoverenv } }
1012   }
1013   {
1014     \NewPitonEnvironment { Piton } { 0 { } }
1015     { \keys_set:nn { PitonOptions } { #1 } }
1016     { }
1017   }

```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

1018 \NewDocumentCommand { \PitonInputFileTF } { d < > 0 { } m m m }
1019   {
1020     \group_begin:

```

In version 4.0 of `piton`, we changed the mechanism used by `piton` to search the file to load with `\PitonInputFile`. With the key `old-PitonInputFile`, it's possible to keep the old behaviour but it's only for backward compatibility and it will be deleted in a future version.

```

1275   Preproc          = \color[HTML]{AA6600} \slshape ,

```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```

1276 Identifier.Internal = \@@_identifier:n ,
1277 Identifier          = ,
1278 Directive           = \color[HTML]{AA6600} ,
1279 Tag                 = \colorbox{gray!10},
1280 UserFunction        = ,
1281 Prompt              = ,
1282 ParseAgain          = \@@_piton_no_cr:n ,
1283 Discard             = \use_none:n
1284 }

```

The styles `ParseAgain.noCR` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document that style for the final user.

If the key `math-comments` has been used in the preamble of the LaTeX document, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```
1285 \hook_gput_code:nnn { begindocument } { . }
1286 {
1287   \bool_if:NT \g_@@_math_comments_bool
1288     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1289 }
```

10.2.10 Highlighting some identifiers

```
1290 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1291 {
1292   \clist_set:Nn \l_tmpa_clist { #2 }
1293   \tl_if_no_value:nTF { #1 }
1294   {
1295     \clist_map_inline:Nn \l_tmpa_clist
1296       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1297   }
1298   {
1299     \str_set:Ne \l_tmpa_str { \str_lowercase:n { #1 } }
1300     \str_if_eq:onT \l_tmpa_str { current-language }
1301       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1302     \clist_map_inline:Nn \l_tmpa_clist
1303       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1304   }
1305 }
1306 \cs_new_protected:Npn \@@_identifier:n #1
1307 {
1308   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1309   {
1310     \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1311       { \PitonStyle { Identifier } }
1312   }
1313 { #1 }
1314 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1315 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1316 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1317 { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1318 \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1319 { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1320 \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1321   { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
```

```

1322 \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
We update \g_@@_languages_seq which is used only by the command \PitonClearUserFunctions
when it's used without its optional argument.
1323 \seq_if_in:Nf \g_@@_languages_seq \l_piton_language_str
1324   { \seq_gput_left:No \g_@@_languages_seq \l_piton_language_str }
1325 }
```

```

1326 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1327 {
1328   \tl_if_novalue:nTF { #1 }
```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```

1329   { \@@_clear_all_functions: }
1330   { \@@_clear_list_functions:n { #1 } }
1331 }

1332 \cs_new_protected:Npn \@@_clear_list_functions:n #1

1570 end
1571 \end{luacode*}
1572 
```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1573 (*LUA)
1574 if piton.comment_latex == nil then piton.comment_latex = ">" end
1575 piton.comment_latex = "#" .. piton.comment_latex
1576 local function sprintL3 ( s )
1577     tex.print ( luatexbase.catcodetables.expl , s )
1578 end

```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1579 local P , S , V , C , Ct , Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1580 local Cs , Cg , Cmt , Cb = lpeg.Cs, lpeg.Cg , lpeg.Cmt , lpeg.Cb
1581 local B , R = lpeg.B , lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG which does a capture of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
1582 local function Q ( pattern )
1583   return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1584 end
```

The function `L` takes in as argument a pattern and returns a LPEG which does a capture of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It’s suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won’t be much used.

```
1585 local function L ( pattern )
1586   return Ct ( C ( pattern ) )
1587 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG with does a constant capture which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that’s the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1588 local function Lc ( string )
1589   return Cc ( { luatexbase.catcodetables.expl , string } )
1590 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1591 e
1592 local function K ( style , pattern )
1593   return
1594     Lc ( "{\\PitonStyle{" .. style .. "}" )
1595     * Q ( pattern )
1596     * Lc "}"
1597 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
1598 local function WithStyle ( style , pattern )
1599   return
1600     Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" ) * Cc "}" )
1601     * pattern
1602     * Ct ( Cc "Close" )
1603 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
1604 Escape = P ( false )
1605 EscapeClean = P ( false )
1606 if piton.begin_escape ~= nil
1607 then
1608   Escape =
1609   P ( piton.begin_escape )
1610   * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1611   * P ( piton.end_escape )
```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1612   EscapeClean =
1613     P ( piton.begin_escape )
1614     * ( 1 - P ( piton.end_escape ) ) ^ 1
1615     * P ( piton.end_escape )
1616 end
1617 EscapeMath = P ( false )
1618 if piton.begin_escape_math ~= nil
1619 then
1620   EscapeMath =
1621     P ( piton.begin_escape_math )
1622     * Lc "\ensuremath{"
1623     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1624     * Lc ( "}" )
1625     * P ( piton.end_escape_math )
1626 end

```

The following line is mandatory.

```
1627 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```

1628 local alpha , digit = lpeg.alpha , lpeg.digit
1629 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, á, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```

1630 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1631           + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
1632           + "Ï" + "Î" + "Ô" + "Û" + "Ü"
1633
1634 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1635 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1636 local Identifier = K ( 'Identifier.Internal' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```

1637 local Number =
1638   K ( 'Number' ,
1639     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1640       + digit ^ 0 * P "." * digit ^ 1
1641       + digit ^ 1 )
1642     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1643     + digit ^ 1
1644   )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1645 local Word
1646 if piton.begin_escape then
1647   if piton.begin_escape_math then
1648     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1649                 - piton.begin_escape_math - piton.end_escape_math
1650                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1651 else
1652   Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1653                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1654 end
1655 else
1656   if piton.begin_escape_math then
1657     Word = Q ( ( 1 - space - piton.begin_escape_math - piton.end_escape_math
1658                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1659 else
1660   Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1661 end
1662 end

1663 local Space = Q " " ^ 1
1664
1665 local SkipSpace = Q " " ^ 0
1666
1667 local Punct = Q ( S ",,:;!" )
1668
1669 local Tab = "\t" * Lc [[\@@_tab:]]

```

Remember that `\@@_leading_space:` does *not* create a space, only an incrementation of the counter `\g_@@_indentation_int`.

```

1670 local SpaceIndentation = Lc [[\@@_leading_space:]] * Q " "
1671 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1672 local VisualSpace = space * Lc [[\l_@@_space_t1]]
```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language).

```

1673 local strict_braces =
1674   P { "E" ,
1675     E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
1676     F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
1677   }

```

Several tools for the construction of the main LPEG

```

1678 local LPEGO = { }
1679 local LPEG1 = { }
1680 local LPEG2 = { }
1681 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shortest strings). The argument of `Compute_braces` must be a pattern *which does no catching*.

```

1682 local function Compute_braces ( lpeg_string ) return
1683   P { "E" ,
1684     E =
1685     (
1686       "{ " * V "E" * "}"
1687       +
1688       lpeg_string
1689       +
1690       ( 1 - S "{}" )
1691     ) ^ 0
1692   }
1693 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures.

```

1694 local function Compute_DetectedCommands ( lang , braces ) return
1695   Ct ( Cc "Open"
1696     * C ( piton.DetectedCommands * space ^ 0 * P "{" )
1697     * Cc "}"
1698   )
1699   * ( braces
1700     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1701   * P "}"
1702   * Ct ( Cc "Close" )
1703 end

1704 local function Compute_LPEG_cleaner ( lang , braces ) return
1705   Ct ( ( piton.DetectedCommands * "{"
1706     * ( braces
1707       / ( function ( s )
1708         if s ~= '' then return LPEG_cleaner[lang] : match ( s ) end end ) )
1709       * "}"
1710       + EscapeClean
1711       + C ( P ( 1 ) )
1712     ) ^ 0 ) / table.concat
1713 end

```

Constructions for Beamer If the class `Beamer` is used, some environments and commands of `Beamer` are automatically detected in the listings of `piton`.

```

1714 local Beamer = P ( false )
1715 local BeamerBeginEnvironments = P ( true )
1716 local BeamerEndEnvironments = P ( true )
1717 piton.BeamerEnvironments = P ( false )
1718 for _ , x in ipairs ( piton.beamer_environments ) do
1719   piton.BeamerEnvironments = piton.BeamerEnvironments + x
1720 end

1721 BeamerBeginEnvironments =
1722   ( space ^ 0 *
1723     L
1724     (
1725       P "\begin{" * piton.BeamerEnvironments * "}"
1726       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1

```

```

1727     )
1728     * "\r"
1729 ) ^ 0

1730 BeamerEndEnvironments =
1731   ( space ^ 0 *
1732     L ( P "\end{" * piton.BeamerEnvironments * "}" )
1733     * "\r"
1734 ) ^ 0

```

The following Lua function will be used to compute the LPEG **Beamer** for each informatic language.

```
1735 local function Compute_Beamer ( lang , braces )
```

We will compute in lpeg the LPEG that we will return.

```

1736   local lpeg = L ( P [[\pause]] * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1737   lpeg = lpeg +
1738     Ct ( Cc "Open"
1739       * C ( piton.BeamerCommands
1740         * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1741         * P "{"
1742           )
1743         * Cc "}"
1744       )
1745     * ( braces /
1746       ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1747     * "}"
1748     * Ct ( Cc "Close" )

```

For the command **\alt**, the specification of the overlays (between angular brackets) is mandatory.

```

1749   lpeg = lpeg +
1750     L ( P [[\alt]] * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1751       * ( braces /
1752         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1753       * L ( P "}{" )
1754       * ( braces /
1755         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1756       * L ( P "}" )

```

For **\temporal**, the specification of the overlays (between angular brackets) is mandatory.

```

1757   lpeg = lpeg +
1758     L ( ( P [[\temporal]] ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1759       * ( braces
1760         / ( function ( s )
1761           if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1762       * L ( P "}{" )
1763       * ( braces
1764         / ( function ( s )
1765           if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1766       * L ( P "}{" )
1767       * ( braces
1768         / ( function ( s )
1769           if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1770       * L ( P "}" )

```

Now, the environments of Beamer.

```

1771   for _ , x in ipairs ( piton.beamer_environments ) do
1772     lpeg = lpeg +
1773       Ct ( Cc "Open"
1774         * C (
1775           P ( "\begin{" .. x .. "}" )

```

```

1776          * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1777          )
1778          * Cc ( "\end{ ... x .. }" )
1779          )
1780          *
1781          ( ( 1 - P ( "\end{ ... x .. }" ) ) ^ 0 )
1782          / ( function ( s )
1783              if s ~= ''
1784                  then return LPEG1[lang] : match ( s )
1785              end
1786          end )
1787          )
1788          * P ( "\end{ ... x .. }" )
1789          * Ct ( Cc "Close" )
1790      end

```

Now, you can return the value we have computed.

```

1791     return lpeg
1792 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1793 local CommentMath =
1794     P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

1795 local PromptHastyDetection =
1796     ( # ( P "">>>" + "...") * Lc [[\@@_prompt:]] ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1797 local Prompt = K ( 'Prompt' , ( ( P "">>>" + "...") * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1798 local EOL =
1799     P "\r"
1800     *
1801     (
1802         space ^ 0 * -1
1803         +

```

We recall that each line of the informatic code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁵.

```

1804     Ct (
1805         Cc "EOL"
1806         *
1807         Ct ( Lc [[\@@_end_line:]]
1808             * BeamerEndEnvironments
1809             *
1810             (

```

³⁵Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

If the last line of the listing is the end of an environment of Beamer (eg. `\end{uncoverenv}`), then, we don't open a new line. A token `\@@_end_line:` will be added at the end of the environment but it will be no-op since we have defined the macro `\@@_end_line:` to be no-op (even though it is also used as a marker for the TeX delimited macro `\@@_begin_line:`).

```

1811      -1
1812      +
1813      BeamerBeginEnvironments
1814      * PromptHastyDetection
1815      * Lc [[\@@_newline:\@@_begin_line:]]
1816      * Prompt
1817      )
1818      )
1819      )
1820  )
1821  * ( SpaceIndentation ^ 0 * # ( 1 - S " \r" ) ) ^ -1

```

The following LPEG CommentLaTeX is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function C) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

1822 local CommentLaTeX =
1823   P ( piton.comment_latex )
1824   * Lc [[{\PitonStyle{Comment.LaTeX}}{\ignorespaces}]]
1825   * L ( ( 1 - P "\r" ) ^ 0 )
1826   * Lc [[]]
1827   * ( EOL + -1 )

```

10.3.2 The language Python

We open a Lua local scope for the language Python (of course, there will be also global definitions).

```
1828 do
```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1829 local Operator =
1830   K ( 'Operator' ,
1831     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
1832     + S "--+/*%=<>&.@"
1833
1834 local OperatorWord =
1835   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword `in` in a construction such as `“for i in range(n)”` must be formatted as a keyword and not as an `Operator.Word` and that's why we write the following LPEG `For`.

```

1836 local For = K ( 'Keyword' , P "for" )
1837   * Space
1838   * Identifier
1839   * Space
1840   * K ( 'Keyword' , P "in" )
1841
1842 local Keyword =
1843   K ( 'Keyword' ,
1844     P "as" + "assert" + "break" + "case" + "class" + "continue" + "def" +
1845     "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
1846     "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
1847     "try" + "while" + "with" + "yield" + "yield from" )
1848   + K ( 'Keyword.Constant' , P "True" + "False" + "None" )
1849
1850 local Builtin =
1851   K ( 'Name.Builtin' ,
1852     P "__import__" + "abs" + "all" + "any" + "bin" + "bool" + "bytearray" +

```

```

1853 "bytes" + "chr" + "classmethod" + "compile" + "complex" + "delattr" +
1854 "dict" + "dir" + "divmod" + "enumerate" + "eval" + "filter" + "float" +
1855 "format" + "frozenset" + "getattr" + "globals" + "hasattr" + "hash" +

1858 + "object" + "oct" + "open" + "ord" + "pow" + "print" + "property" +
1859 "range" + "repr" + "reversed" + "round" + "set" + "setattr" + "slice" +
1860 "sorted" + "staticmethod" + "str" + "sum" + "super" + "tuple" + "type" +
1861 "vars" + "zip" )

1862
1863 local Exception =
1864   K ( 'Exception' ,
1865     P "ArithmsetError" + "AssertionError" + "AttributeError" +
1866     "BaseException" + "BufferError" + "BytesWarning" + "DeprecationWarning" +
1867     "EOFError" + "EnvironmentError" + "Exception" + "FloatingPointError" +
1868     "FutureWarning" + "GeneratorExit" + "IOError" + "ImportError" +
1869     "ImportWarning" + "IndentationError" + "IndexError" + "KeyError" +
1870     "KeyboardInterrupt" + "LookupError" + "MemoryError" + "NameError" +
1871     "NotImplementedError" + "OSError" + "OverflowError" +
1872     "PendingDeprecationWarning" + "ReferenceError" + "ResourceWarning" +
1873     "RuntimeError" + "RuntimeWarning" + "StopIteration" + "SyntaxError" +
1874     "SyntaxWarning" + "SystemError" + "SystemExit" + "TabError" + "TypeError" +
1875     + "UnboundLocalError" + "UnicodeDecodeError" + "UnicodeEncodeError" +
1876     "UnicodeError" + "UnicodeTranslateError" + "UnicodeWarning" +
1877     "UserWarning" + "ValueError" + "VMSError" + "Warning" + "WindowsError" +
1878     "ZeroDivisionError" + "BlockingIOError" + "ChildProcessError" +
1879     "ConnectionError" + "BrokenPipeError" + "ConnectionAbortedError" +
1880     "ConnectionRefusedError" + "ConnectionResetError" + "FileExistsError" +
1881     "FileNotFoundException" + "InterruptedError" + "IsADirectoryError" +
1882     "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1883     "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
1884     "RecursionError" )

1885
1886 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
1887 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
1888 local DefClass =
1889   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
1890 local ImportAs =
1891   K ( 'Keyword' , "import" )
1892   * Space
1893   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1894   * (
1895     ( Space * K ( 'Keyword' , "as" ) * Space
```

```

1896      * K ( 'Name.Namespace' , identifier ) )
1897      +
1898      ( SkipSpace * Q "," * SkipSpace
1899          * K ( 'Name.Namespace' , identifier ) ) ^ 0
1900
)

```

Be careful: there is no commutativity of + in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1901 local FromImport =
1902     K ( 'Keyword' , "from" )
1903     * Space * K ( 'Name.Namespace' , identifier )
1904     * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁶ in that interpolation:

```
f'Total price: {total:+1:.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```

1905 local PercentInterpol =
1906     K ( 'String.Interpol' ,
1907         P "%"
1908         * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1909         * ( S "-#0 +" ) ^ 0
1910         * ( digit ^ 1 + "*" ) ^ -1
1911         * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1912         * ( S "HLL" ) ^ -1
1913         * S "sdfFeExXorgiGauc%"
1914     )

```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function `K` because of the interpolations which must be formatted with another piton style that the rest of the string.³⁷

```

1915 local SingleShortString =
1916     WithStyle ( 'String.Short' ,

```

³⁶There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

³⁷The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

First, we deal with the f-strings of Python, which are prefixed by `f` or `F`.

```

1917 Q ( P "f'" + "F'" )
1918   *
1919     K ( 'String.Interpol' , "{}" )
1920     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
1921     * Q ( P ":" * ( 1 - S "}:;" ) ^ 0 ) ^ -1
1922     * K ( 'String.Interpol' , "}" )
1923   +
1924     VisualSpace
1925   +
1926     Q ( ( P "\\" + "\\\\" + "{{" + "}}}" + 1 - S " {}'" ) ^ 1 )
1927   ) ^ 0
1928   * Q """
1929 +

```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```

1930 Q ( P """ + "r'" + "R'" )
1931   * ( Q ( ( P "\\" + "\\\\" + 1 - S " \r%" ) ^ 1 )
1932     + VisualSpace
1933     + PercentInterpol
1934     + Q "%"
1935   ) ^ 0
1936   * Q """
1937 local DoubleShortString =
1938   WithStyle ( 'String.Short' ,
1939     Q ( P "f\\"" + "F\\"" )
1940   *
1941     K ( 'String.Interpol' , "{}" )
1942     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
1943     * ( K ( 'String.Interpol' , ":" ) * Q ( ( 1 - S "}:;" ) ^ 0 ) ) ^ -1
1944     * K ( 'String.Interpol' , "}" )
1945   +
1946     VisualSpace
1947   +
1948     Q ( ( P "\\\\" + "\\\\" + "{{" + "}}}" + 1 - S " {}\"") ^ 1 )
1949   ) ^ 0
1950   * Q """
1951 +
1952   Q ( P "\\" + "r\\"" + "R\\"" )
1953   * ( Q ( ( P "\\\\" + "\\\\" + 1 - S " \r%" ) ^ 1 )
1954     + VisualSpace
1955     + PercentInterpol
1956     + Q "%"
1957   ) ^ 0
1958   * Q """
1959
1960 local ShortString = SingleShortString + DoubleShortString

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

1961 local braces =
1962   Compute_braces
1963   (
1964     ( P "\\" + "r\\"" + "R\\"" + "f\\"" + "F\\"" )
1965     * ( P "\\\\" + 1 - S " \\" ) ^ 0 * "\\""
1966   +
1967     ( P '\'' + 'r\'' + 'R\'' + 'f\'' + 'F\'' )
1968     * ( P '\\\\' + 1 - S '\'' ) ^ 0 * '\'
1969   )
1970 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

Detected commands

```
1971 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
```

LPEG_cleaner

```
1972 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )
```

The long strings

```

2025     * Q "\\"\\\""
2026   )
2027 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```

2028 local StringDoc =
2029   K ( 'String.Doc' , P "r" ^ -1 * "\\"\\\""
2030   * ( K ( 'String.Doc' , (1 - P "\\"\\\" - "\r" ) ^ 0 ) * EOL
2031   * Tab ^ 0
2032   ) ^ 0
2033   * K ( 'String.Doc' , (1 - P "\\"\\\" - "\r" ) ^ 0 * "\\"\\\"")

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

2034 local Comment =
2035   WithStyle
2036   ( 'Comment' ,
2037     Q "#" * ( CommentMath + Q ( (1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
2038   )
2039   * ( EOL + -1 )

```

DefFunction The following LPEG expression will be used for the parameters in the `argspec` of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2040 local expression =
2041   P { "E" ,
2042     E = ( "" * ( P "\\\\" + 1 - S "'\r" ) ^ 0 * """
2043     + "\\" * ( P "\\\\" + 1 - S "\\"'\r" ) ^ 0 * "\\""
2044     + "{} * V "F" * "}""
2045     + "(" * V "F" * ")"
2046     + "[" * V "F" * "]"
2047     + ( 1 - S "{}()[]\r," ) ^ 0 ,
2048     F = ( "{} * V "F" * "}""
2049     + "(" * V "F" * ")"
2050     + "[" * V "F" * "]"
2051     + ( 1 - S "{}()[]\r\"\"") ^ 0
2052   }

```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the `argspec`) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int`.

```

2053 local Params =
2054   P { "E" ,
2055     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2056     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2057     * (
2058       K ( 'InitialValues' , "=" * expression )
2059       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2060     ) ^ -1
2061   }

```

The following LPEG DefFunction catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

2062 local DefFunction =
2063   K ( 'Keyword' , "def" )
2064   * Space
2065   * K ( 'Name.Function.Internal' , identifier )
2066   * SkipSpace
2067   * Q "(" * Params * Q ")"
2068   * SkipSpace
2069   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain.noCR` which will be linked to `\@_piton_no_cr:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

2070   * K ( 'ParseAgain.noCR' , ( 1 - S ":\\r" ) ^ 0 )
2071   * Q ":" 
2072   * ( SkipSpace
2073     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2074     * Tab ^ 0
2075     * SkipSpace
2076     * StringDoc ^ 0 -- there may be additional docstrings
2077   ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG `Keyword` (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```

2078 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL

```

The main LPEG for the language Python

```

2079 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2080 local Main =
2081   space ^ 0 * EOL -- faut-il le mettre en commentaire ?
2082   + Space
2083   + Tab
2084   + Escape + EscapeMath
2085   + CommentLaTeX
2086   + Beamer
2087   + DetectedCommands
2088   + LongString
2089   + Comment
2090   + ExceptionInConsole
2091   + Delim
2092   + Operator
2093   + OperatorWord * EndKeyword
2094   + ShortString
2095   + Punct
2096   + FromImport
2097   + RaiseException
2098   + DefFunction
2099   + DefClass
2100   + For
2101   + Keyword * EndKeyword
2102   + Decorator
2103   + Builtin * EndKeyword

```

```

2104     + Identifier
2105     + Number
2106     + Word

```

Here, we must not put local!

```
2107 LPEG1['python'] = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@_begin_line: - \@_end_line:`³⁸.

```

2108 LPEG2['python'] =
2109   Ct (
2110     ( space ^ 0 * "\r" ) ^ -1
2111     * BeamerBeginEnvironments
2112     * PromptHastyDetection
2113     * Lc [[\@_begin_line:]]
2114     * Prompt
2115     * SpaceIndentation ^ 0
2116     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2117     * -1
2118     * Lc [[\@_end_line:]]
2119   )

```

End of the Lua scope for the language Python.

```
2120 end
```

10.3.3 The language Ocaml

We open a Lua local scope for the language OCaml (of course, there will be also global definitions).

```

2121 do
2122   local SkipSpace = ( Q " " + EOL ) ^ 0
2123   local Space = ( Q " " + EOL ) ^ 1
2124   local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2125   if piton.beamer then
2126     Beamer = Compute_Beamer ( 'ocaml' , braces )
2127   end
2128   DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )
2129   local function Q ( pattern )
2130     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther )
2131               * C ( pattern ) )
2132     + Beamer + DetectedCommands + EscapeMath + Escape
2133   end
2134   local function K ( style , pattern )
2135     return
2136       Lc ( "{\\PitonStyle{" .. style .. "}" .. )
2137       * Q ( pattern )
2138       * Lc "}" )
2139   end

```

³⁸Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2140 local function WithStyle ( style , pattern )
2141   return
2142     Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" .. "}" ) * Cc "}" ) )
2143   * ( pattern + Beamer + DetectedCommands + EscapeMath + Escape )
2144   * Ct ( Cc "Close" )
2145 end

```

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write $(1 - S "()")$ with outer parenthesis.

```

2146 local balanced_parens =
2147 P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "()" ) ) ^ 0 }

```

The strings of OCaml

```

2148 local ocaml_string =
2149   Q "\\""
2150   *
2151   VisualSpace
2152   +
2153   Q ( ( 1 - S " \r" ) ^ 1 )
2154   +
2155   EOL
2156   ) ^ 0
2157   * Q "\\"
2158 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2159 local ext = ( R "az" + "_" ) ^ 0
2160 local open = "{" * Cg ( ext , 'init' ) * "|"
2161 local close = "|" * C ( ext ) * "}"
2162 local closeeq =
2163   Cmt ( close * Cb ( 'init' ) ,
2164         function ( s , i , a , b ) return a == b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

2165 local QuotedStringBis =
2166   WithStyle ( 'String.Long' ,
2167   (
2168     Space
2169     +
2170     Q ( ( 1 - S " \r" ) ^ 1 )
2171     +
2172     EOL
2173   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2174 local QuotedString =
2175   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2176   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

In OCaml, the delimiters for the comments are `(* and *)`. There are unsymmetrical and OCaml allows those comments to be nested. That's why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2177 local Comment =

```

```

2178  WithStyle ( 'Comment' ,
2179    P {
2180      "A" ,
2181      A = Q "(*"
2182      * ( V "A"
2183      + Q ( ( 1 - S "\r$\" - "(*" - "*)" ) ^ 1 ) -- $
2184      + ocaml_string
2185      + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2186      + EOL
2187      ) ^ 0
2188      * Q "*)"
2189    } )

```

Some standard LPEG

```

2190  local Delim = Q ( P "[" + "]" + S "[()]" )
2191  local Punct = Q ( S ",;:;" )

```

The identifiers caught by `cap_identifier` begin with a capital. In OCaml, it's used for the constructors of types and for the names of the modules.

```
2192  local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
```

```

2193  local Constructor =
2194    K ( 'Name.Constructor' ,
2195      Q "`" ^ -1 * cap_identifier

```

We consider `::` and `[]` as constructors (of the lists) as does the Tuareg mode of Emacs.

```

2196  + Q "::"
2197  + Q "[" * SkipSpace * Q "]"

```

```
2198  local ModuleType = K ( 'Name.Type' , cap_identifier )
```

```

2199  local OperatorWord =
2200    K ( 'Operator.Word' ,
2201      P "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )

```

In OCaml, some keywords are considered as *governing keywords* with some special syntactic characteristics.

```

2202  local governing_keyword = P "and" + "begin" + "class" + "constraint" +
2203    "end" + "external" + "functor" + "include" + "inherit" + "initializer" +
2204    "in" + "let" + "method" + "module" + "object" + "open" + "rec" + "sig" +
2205    "struct" + "type" + "val"

```

```

2206  local Keyword =
2207    K ( 'Keyword' ,
2208      P "assert" + "as" + "done" + "downto" + "do" + "else" + "exception"
2209      + "for" + "function" + "fun" + "if" + "lazy" + "match" + "mutable"
2210      + "new" + "of" + "private" + "raise" + "then" + "to" + "try"
2211      + "virtual" + "when" + "while" + "with" )
2212    + K ( 'Keyword.Constant' , P "true" + "false" )
2213    + K ( 'Keyword.Governing' , governing_keyword )

```

```

2214  local EndKeyword
2215  = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

Now, the identifier. Recall that we have also a LPEG `cap_identifier` for the identifiers beginning with a capital letter.

```

2216  local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2217  - ( OperatorWord + Keyword ) * EndKeyword

```

We have the internal style `Identifier.Internal` in order to be able to implement the mechanism `\SetPitonIdentifier`. The final user has access to a style called `Identifier`.

```
2218 local Identifier = K ( 'Identifier.Internal' , identifier )
```

In OCmal, *character* is a type different of the type `string`.

```
2219 local Char =
2220   K ( 'String.Short' ,
2221     P "" * "
2222     (
2223       ( 1 - S "'\\\" )
2224       + "\\\" *
2225         * ( S "\\\'ntbr \""
2226           + digit * digit * digit
2227           + P "x" * ( digit + R "af" + R "AF" )
2228             * ( digit + R "af" + R "AF" )
2229               * ( digit + R "af" + R "AF" )
2230                 + P "o" * R "03" * R "07" * R "07" )
2231   )
2232   * "" )
```

For the parameter of the types (for example : `\\a as in `a list).

```
2233 local TypeParameter =
2234   K ( 'TypeParameter' ,
2235     "" * Q"_" ^ -1 * alpha ^ 1 * ( # ( 1 - P "" ) + -1 ) )
```

The records

```
2236 local expression_for_fields_type =
2237   P { "E" ,
2238     E = (   "{} * V "F" * "}"
2239       + "(" * V "F" * ")"
2240       + TypeParameter
2241       + ( 1 - S "{}()[]\r;" ) ^ 0 ,
2242     F = (   "{} * V "F" * "}"
2243       + "(" * V "F" * ")"
2244       + ( 1 - S "{}()[]\r\""" ) + TypeParameter ) ^ 0
2245   }

2246 local expression_for_fields_value =
2247   P { "E" ,
2248     E = (   "{} * V "F" * "}"
2249       + "(" * V "F" * ")"
2250       + "[" * V "F" * "]"
2251       + String + QuotedString + Char
2252       + ( 1 - S "{}()[]\r;" ) ^ 0 ,
2253     F = (   "{} * V "F" * "}"
2254       + "(" * V "F" * ")"
2255       + "[" * V "F" * "]"
2256       + ( 1 - S "{}()[]\r\""" ) ) ^ 0
2257   }

2258 local OneFieldDefinition =
2259   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2260   * K ( 'Name.Field' , identifier ) * SkipSpace
2261   * Q ":" * SkipSpace
2262   * K ( 'TypeExpression' , expression_for_fields_type )
2263   * SkipSpace
```

```

2264 local OneField =
2265   K ( 'Name.Field' , identifier ) * SkipSpace
2266   * Q "=" * SkipSpace
2267   * ( expression_for_fields_value
2268     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2269   )
2270   * SkipSpace

```

The *records* may occur in the definitions of type (beginning by `type`) but also when used as values.

```

2271 local Record =
2272   Q "{" * SkipSpace
2273   *
2274   (
2275     OneFieldDefinition
2276     * ( Q ";" * SkipSpace * ( Comment * SkipSpace ) ^ 0 * OneFieldDefinition ) ^ 0
2277     +
2278     OneField * ( Q ";" * SkipSpace * ( Comment * SkipSpace ) ^ 0 * OneField ) ^ 0
2279   )
2280   * SkipSpace

End of the Lua scope for the language OCaml.

```
2448 end
```

10.3.4 The language C

We open a Lua local scope for the language C (of course, there will be also global definitions).

```
2449 do
```

```

2450 local Delim = Q ( S "{[()]}")
2451 local Punct = Q ( S ",:;!" )

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2452 local identifier = letter * alphanum ^ 0
2453
2454 local Operator =
2455   K ( 'Operator' ,
2456       P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "||" + "&&"
2457       + S "-~+/*%=<>&.@"
2458
2459 local Keyword =
2460   K ( 'Keyword' ,
2461       P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +
2462       "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +

```

```

2463     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
2464     "register" + "restricted" + "return" + "static" + "static_assert" +
2465     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
2466     "union" + "using" + "virtual" + "volatile" + "while"
2467   )
2468 + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )

2469 local Builtin =
2470   K ( 'Name.Builtin' ,
2471     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )

2472 local Type =
2473   K ( 'Name.Type' ,
2474     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2475     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2476     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2477
2478 local DefFunction =
2479   Type
2480   * Space
2481   * Q "*" ^ -1
2482   * K ( 'Name.Function.Internal' , identifier )
2483   * SkipSpace
2484   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

2487 local DefClass =
2488   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```

2489 String =
2490   WithStyle ( 'String.Long' ,
2491     Q """
2492     * ( VisualSpace
2493       + K ( 'String.Interpol' ,
2494         "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )
2495       )
2496       + Q ( ( P "\\\\" + 1 - S " \" " ) ^ 1 )
2497     ) ^ 0
2498   * Q """
2499 )

```

Beamer The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

2500 local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2501 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2502 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2503 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```
2504 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )
```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```
2505 local Comment =
2506   WithStyle ( 'Comment' ,
2507     Q "//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2508     * ( EOL + -1 )
2509
2510 local LongComment =
2511   WithStyle ( 'Comment' ,
2512     Q "/*"
2513       * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2514       * Q "*/"
2515     ) -- $
```

The main LPEG for the language C

```
2516 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```
2517 local Main =
2518   space ^ 0 * EOL
2519   + Space
2520   + Tab
2521   + Escape + EscapeMath
2522   + CommentLaTeX
2523   + Beamer
2524   + DetectedCommands
2525   + Preproc
2526   + Comment + LongComment
2527   + Delim
2528   + Operator
2529   + String
2530   + Punct
2531   + DefFunction
2532   + DefClass
2533   + Type * ( Q "*" ^ -1 + EndKeyword )
2534   + Keyword * EndKeyword
2535   + Builtin * EndKeyword
2536   + Identifier
2537   + Number
2538   + Word
```

Here, we must not put local!

```
2539 LPEG1['c'] = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@_begin_line: - \@_end_line:`³⁹.

```
2540 LPEG2['c'] =
2541   Ct (
2542     ( space ^ 0 * P "\r" ) ^ -1
2543     * BeamerBeginEnvironments
2544     * Lc [[\@_begin_line:]])
```

³⁹Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2545     * SpaceIndentation ^ 0
2546     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2547     * -1
2548     * Lc [[\@@_end_line:]]
2549 )

```

End of the Lua scope for the language C.

```
2550 end
```

10.3.5 The language SQL

We open a Lua local scope for the language SQL (of course, there will be also global definitions).

```
2551 do
```

```

2552     local function LuaKeyword ( name )
2553         return
2554             Lc [[{\PitonStyle{Keyword}{}}
2555             * Q ( Cmt (
2556                 C ( identifier ) ,
2557                 function ( s , i , a ) return string.upper ( a ) == name end
2558             )
2559         )
2560         * Lc "}]"
2561     end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```

2562     local identifier =
2563         letter * ( alphanum + "-" ) ^ 0
2564         + P '!' * ( ( 1 - P '!' ) ^ 1 ) * '!'
2565     local Operator =
2566         K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```

2567     local function Set ( list )
2568         local set = { }
2569         for _, l in ipairs ( list ) do set[l] = true end
2570         return set
2571     end

2572     local set_keywords = Set
2573     {
2574         "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2575         "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2576         "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,
2577         "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,
2578         "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,
2579         "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2580     }

2581     local set_builtins = Set
2582     {
2583         "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2584         "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2585         "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2586     }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2587 local Identifier =
2588   C ( identifier ) /
2589   (
2590     function (s)
2591       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL
2592         then return { {"\\PitonStyle{Keyword}" } ,
2593                       { luatexbase.catcodetables.other , s } ,
2594                       { "}" } }
2595       else if set_builtins[string.upper(s)]
2596         then return { {"\\PitonStyle{Name.Builtin}" } ,
2597                       { luatexbase.catcodetables.other , s } ,
2598                       { "}" } }
2599       else return { {"\\PitonStyle{Name.Field}" } ,
2600                       { luatexbase.catcodetables.other , s } ,
2601                       { "}" } }
2602     end
2603   end
2604 end
2605 )

```

The strings of SQL

```

2606 local String = K ( 'String.Long' , "" * ( 1 - P "" ) ^ 1 * "" )

```

Beamer The argument of Compute_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```

2607 local braces = Compute_braces ( "" * ( 1 - P "" ) ^ 1 * "" )

2749   * Lc [[\@@_end_line:]]
2750 )

```

End of the Lua scope for the language “minimal”.

```
2751 end
```

10.3.7 The function Parse

The function **Parse** is the main function of the package **piton**. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`LPEG2[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```

2752 function piton.Parse ( language , code )
2753   local t = LPEG2[language] : match ( code )
2754   if t == nil
2755     then
2756       sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
2757       return -- to exit in force the function
2758     end
2759   local left_stack = {}
2760   local right_stack = {}
2761   for _ , one_item in ipairs ( t ) do
2762     if one_item[1] == "EOL" then
2763       for _ , s in ipairs ( right_stack ) do
2764         tex.sprint ( s )
2765       end
2766       for _ , s in ipairs ( one_item[2] ) do
2767         tex.tprint ( s )
2768       end
2769       for _ , s in ipairs ( left_stack ) do
2770         tex.sprint ( s )
2771       end
2772     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\begin{uncover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{uncover}`.

```
2773     if one_item[1] == "Open" then
2774         tex.sprint( one_item[2] )
2775         table.insert ( left_stack , one_item[2] )
2776         table.insert ( right_stack , one_item[3] )
2777     else
2778         if one_item[1] == "Close" then
2779             tex.sprint ( right_stack[#right_stack] )
280             left_stack[#left_stack] = nil
281             right_stack[#right_stack] = nil
282         else
283             tex.tprint ( one_item )
284         end
285     end
286 end
287 end
288 end
```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```
2789 function piton.ParseFile
2790     ( lang , name , first_line , last_line , splittable , split )
2791     local s = ''
2792     local i = 0
2793     for line in io.lines ( name ) do
2794         i = i + 1
2795         if i >= first_line then
2796             s = s .. '\r' .. line
2797         end
2798         if i >= last_line then break end
2799     end
```

We extract the BOM of utf-8, if present.

```
2800     if string.byte ( s , 1 ) == 13 then
2801         if string.byte ( s , 2 ) == 239 then
2802             if string.byte ( s , 3 ) == 187 then
2803                 if string.byte ( s , 4 ) == 191 then
2804                     s = string.sub ( s , 5 , -1 )
2805                 end
2806             end
2807         end
2808     end
2809     if split == 1 then
2810         piton.RetrieveGobbleSplitParse ( lang , 0 , splittable , s )
2811     else
2812         piton.RetrieveGobbleParse ( lang , 0 , splittable , s )
2813     end
2814 end

2815 function piton.RetrieveGobbleParse ( lang , n , splittable , code )
2816     local s
2817     s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
2818     piton.GobbleParse ( lang , n , splittable , s )
2819 end
```

10.3.8 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```
2820 function piton.ParseBis ( lang , code )
2821   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2822   return piton.Parse ( lang , s )
2823 end
```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2824 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space::`

```
2825   local s
2826   s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2827   : match ( code )
```

Remember that `\@@_leading_space:` does not create a space, only an incrementation of the counter `\g_@@_indentation_int`. That's why we don't replace it by a space...

```
2828   s = ( Cs ( ( P [[\@@_leading_space: ]] / ' ' + 1 ) ^ 0 ) )
2829   : match ( s )
2830   return piton.Parse ( lang , s )
2831 end
```

10.3.9 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```
2832 local AutoGobbleLPEG =
2833   (
2834     P " " ^ 0 * "\r"
2835     +
2836     Ct ( C " " ^ 0 ) / table.getn
2837     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2838   ) ^ 0
2839   * ( Ct ( C " " ^ 0 ) / table.getn
2840         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2841 ) / math.min
```

The following LPEG is similar but works with the tabulations.

```
2842 local TabsAutoGobbleLPEG =
2843   (
2844     (
2845       P "\t" ^ 0 * "\r"
2846       +
2847       Ct ( C "\t" ^ 0 ) / table.getn
2848       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2849     ) ^ 0
2850     * ( Ct ( C "\t" ^ 0 ) / table.getn
2851           * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2852   ) / math.min
```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2853 local EnvGobbleLPEG =
2854   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2855   * Ct ( C " " ^ 0 * -1 ) / table.getn
2856
2857 local function remove_before_cr ( input_string )
2858   local match_result = ( P "\r" ) : match ( input_string )
2859   if match_result then
2860     return string.sub ( input_string , match_result )
2861   else
2862     return input_string
2863   end
2864 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

2864 local function gobble ( n , code )
2865   code = remove_before_cr ( code )
2866   if n == 0 then
2867     return code
2868   else
2869     if n == -1 then
2870       n = AutoGobbleLPEG : match ( code )
2871     else
2872       if n == -2 then
2873         n = EnvGobbleLPEG : match ( code )
2874       else
2875         if n == -3 then
2876           n = TabsAutoGobbleLPEG : match ( code )
2877         end
2878       end
2879     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2880   if n == 0 then
2881     return code
2882   else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of n .

```

2883   return
2884   ( Ct (
2885     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2886     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2887     ) ^ 0 )
2888     / table.concat
2889   ) : match ( code )
2890 end
2891 end
2892 end

```

In the following code, `n` is the value of `\l_@@_gobble_int`.
`splittable` is the value of `\l_@@_splittable_int`.

```

2893 function piton.GobbleParse ( lang , n , splittable , code )
2894   piton.ComputeLinesStatus ( code , splittable )
2895   piton.last_code = gobble ( n , code )
2896   piton.last_language = lang

```

We count the number of lines of the informatic code. The result will be stored by Lua in `\l_@@_nb_lines_int`.

```

2897 piton.CountLines ( piton.last_code )
2898 sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes ]]
2899 piton.Parse ( lang , piton.last_code )
2900 sprintL3 [[ \vspace{2.5pt} ]]
2901 sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \endsavenotes ]]

```

We finish the paragraph (each line of the listing is composed in a TeX box — with potentially several lines when `break-lines-in-Piton` is in force — put alone in a paragraph).

```
2902 sprintL3 [[ \par ]]
```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```

2903 if piton.write and piton.write ~= '' then
2904     local file = io.open ( piton.write , piton.write_mode )
2905     if file then
2906         file:write ( piton.get_last_code ( ) )
2907         file:close ( )
2908     else
2909         sprintL3 [[ \@@_error_or_warning:n { FileError } ]]
2910     end
2911 end
2912 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```

2913 function piton.GobbleSplitParse ( lang , n , splittable , code )
2914     local chunks
2915     chunks =
2916     (
2917         Ct (
2918             (
2919                 P " " ^ 0 * "\r"
2920                 +
2921                 C ( ( ( 1 - P "\r" ) ^ 1 * "\r" - ( P " " ^ 0 * "\r" ) ) ^ 1 )
2922             ) ^ 0
2923         )
2924     ) : match ( gobble ( n , code ) )
2925     sprintL3 ( [[ \begingroup ]] )
2926     sprintL3
2927     (
2928         [[ \PitonOptions { split-on-empty-lines=false, gobble = 0, }]
2929         .. "language = " .. lang .. ","
2930         .. "splittable = " .. splittable .. "}"
2931     )
2932     for k , v in pairs ( chunks ) do
2933         if k > 1 then
2934             sprintL3 ( [[\l_@@_split_separation_t1 ]] )
2935         end
2936         tex.sprint
2937         (
2938             [[\begin{}]] .. piton.env_used_by_split .. "}\r"
2939             .. v
2940             .. [[\end{}]] .. piton.env_used_by_split .. "}"
2941         )
2942     end
2943     sprintL3 ( [[ \endgroup ]] )
2944 end

```

```

2945 function piton.RetrieveGobbleSplitParse ( lang , n , splittable , code )
2946   local s
2947   s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
2948   piton.GobbleSplitParse ( lang , n , splittable , s )
2949 end

```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibility. The token list `\l_@@_split_separation_t1` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

2950 piton.string_between_chunks =
2951 [[ \par \l_@@_split_separation_t1 \mode_leave_vertical: ]]
2952 .. [[ \int_gzero:N \g_@@_line_int ]]

```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

2953 function piton.get_last_code ( )
2954   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2955 end

```

10.3.10 To count the number of lines

```

2956 function piton.CountLines ( code )
2957   local count = 0
2958   count =
2959     ( Ct ( ( ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2960           * ( ( 1 - P "\r" ) ^ 1 * Cc "\r" ) ^ -1
2961           * -1
2962         ) / table.getn
2963       ) : match ( code )
2964   sprintL3 ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
2965 end

```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```

2966 function piton.CountNonEmptyLines ( code )
2967   local count = 0
2968   count =
2969     ( Ct ( ( P " " ^ 0 * "\r"
2970             + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2971             * ( 1 - P "\r" ) ^ 0
2972             * -1
2973           ) / table.getn
2974         ) : match ( code )
2975   sprintL3
2976   ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { %i } ]], count ) )
2977 end

```

```

2978 function piton.CountLinesFile ( name )
2979   local count = 0
2980   for line in io.lines ( name ) do count = count + 1 end
2981   sprintL3
2982   ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
2983 end

```

```

2984 function piton.CountNonEmptyLinesFile ( name )

```

```

2985 local count = 0
2986 for line in io.lines ( name )
2987 do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2988     count = count + 1
2989 end
2990 end
2991 sprintL3
2992 ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]] , count ) )
2993 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2994 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2995     local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2996     local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2997     local first_line = -1
2998     local count = 0
2999     local last_found = false
3000     for line in io.lines ( file_name )
3001     do if first_line == -1
3002         then if string.sub ( line , 1 , #s ) == s
3003             then first_line = count
3004             end
3005         else if string.sub ( line , 1 , #t ) == t
3006             then last_found = true
3007             break
3008             end
3009         end
3010         count = count + 1
3011     end
3012     if first_line == -1
3013     then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
3014     else if last_found == false
3015         then sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
3016         end
3017     end
3018     sprintL3 (
3019         [[ \int_set:Nn \l_@@_first_line_int { [] } .. first_line .. ' + 2 }'
3020         .. [[ \int_set:Nn \l_@@_last_line_int { [] } .. count .. ' }' ])
3021 end

```

10.3.11 To determine the empty lines of the listings

Despite its name, the Lua function `ComputeLinesStatus` computes `piton.lines_status` but also `piton.empty_lines`.

In `piton.empty_lines`, a line will have the number 0 if it's a empty line (in fact a blank line, with only spaces) and 1 elsewhere.

In `piton.lines_status`, each line will have a status with regard the breaking points allowed (for the changes of pages).

- 0 if the line is empty and a page break is allowed;
- 1 if the line is not empty but a page break is allowed after that line;
- 2 if a page break is *not* allowed after that line (empty or not empty).

`splittable` is the value of `\l_@@_splittable_int`. However, if `splittable-on-empty-lines` is in force, `splittable` is the opposite of `\l_@@_splittable_int`.

```

3022 function piton.ComputeLinesStatus ( code , splittable )

```

The lines in the listings which correspond to the beginning or the end of an environment of Beamer (eg. `\begin{uncoverenv}`) must be retrieved (those lines have *no* number and therefore, *no* status).

```

3023 local lpeg_line_beamer
3024 if piton.beamer then
3025   lpeg_line_beamer =
3026     space ^ 0
3027     * P "\begin{" * piton.BeamerEnvironments * "}"
3028     * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
3029   +
3030   space ^ 0
3031     * P "\end{" * piton.BeamerEnvironments * "}"
3032 else
3033   lpeg_line_beamer = P ( false )
3034 end
3035 local lpeg_empty_lines =
3036 Ct (
3037   ( lpeg_line_beamer * "\r"
3038     +
3039     P " " ^ 0 * "\r" * Cc ( 0 )
3040     +
3041     ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3042   ) ^ 0
3043   *
3044   ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3045 )
3046 * -1
3047 local lpeg_all_lines =
3048 Ct (
3049   ( lpeg_line_beamer * "\r"
3050     +
3051     ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3052   ) ^ 0
3053   *
3054   ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3055 )
3056 * -1

```

We begin with the computation of `piton.empty_lines`. It will be used in conjunction with `line-numbers`.

```
3057 piton.empty_lines = lpeg_empty_lines : match ( code )
```

Now, we compute `piton.lines_status`. It will be used in conjunction with `splittable` and `splittable-on-empty-lines`.

Now, we will take into account the current value of `\l_@@_splittable_int` (provided by the *absolute value* of the argument `splittable`).

```

3058 local lines_status
3059 local s = splittable
3060 if splittable < 0 then s = - splittable end
3061 if splittable > 0 then
3062   lines_status = lpeg_all_lines : match ( code )
3063 else

```

Here, we should try to copy `piton.empty_lines` but it's not easy.

```

3064 lines_status = lpeg_empty_lines : match ( code )
3065 for i , x in ipairs ( lines_status ) do
3066   if x == 0 then
3067     for j = 1 , s - 1 do
3068       if i + j > #lines_status then break end
3069       if lines_status[i+j] == 0 then break end
3070       lines_status[i+j] = 2
3071     end
3072     for j = 1 , s - 1 do

```

```

3073     if i - j - 1 == 0 then break end
3074     if lines_status[i-j-1] == 0 then break end
3075     lines_status[i-j-1] = 2
3076   end
3077 end
3078 end
3079 end

```

In all cases (whatever is the value of `splittable-on-empty-lines`) we have to deal with both extremities of the listing to format.

First from the beginning of the code.

```

3080 for j = 1 , s - 1 do
3081   if j > #lines_status then break end
3082   if lines_status[j] == 0 then break end
3083   lines_status[j] = 2
3084 end

```

Now, from the end of the code.

```

3085 for j = 1 , s - 1 do
3086   if #lines_status - j == 0 then break end
3087   if lines_status[#lines_status - j] == 0 then break end
3088   lines_status[#lines_status - j] = 2
3089 end

3090 piton.lines_status = lines_status
3091 end

```

10.3.12 To create new languages with the syntax of listings

```

3092 function piton.new_language ( lang , definition )
3093   lang = string.lower ( lang )

3094   local alpha , digit = lpeg.alpha , lpeg.digit
3095   local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `alsoother`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

3096   function add_to_letter ( c )
3097     if c ~= " " then table.insert ( extra_letters , c ) end
3098   end

```

For the digits, it's straightforward.

```

3099   function add_to_digit ( c )
3100     if c ~= " " then digit = digit + c end
3101   end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

3102   local other = S ":_@+*/<>!?;.:()~^=#!\"\\\$" -- $
3103   local extra_others = { }
3104   function add_to_other ( c )
3105     if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

3106     extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

3107     other = other + P ( c )
3108   end
3109 end

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

3110 local cut_definition =
3111   P { "E" ,
3112     E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
3113     F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
3114       * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
3115   }
3116 local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

3117 local tex_braced_arg = "{" * C ( ( 1 - P "}" ) ^ 0 ) * "}"
3118 local tex_arg = tex_braced_arg + C ( 1 )
3119 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
3120 local args_for_tag
3121   = tex_option_arg
3122   * space ^ 0
3123   * tex_arg
3124   * space ^ 0
3125   * tex_arg
3126 local args_for_morekeywords
3127   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3128   * space ^ 0
3129   * tex_option_arg
3130   * space ^ 0
3131   * tex_arg
3132   * space ^ 0
3133   * ( tex_braced_arg + Cc ( nil ) )
3134 local args_for_moredelims
3135   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
3136   * args_for_morekeywords
3137 local args_for_morecomment
3138   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3139   * space ^ 0
3140   * tex_option_arg
3141   * space ^ 0
3142   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

3143 local sensitive = true
3144 local style_tag , left_tag , right_tag
3145 for _ , x in ipairs ( def_table ) do
3146   if x[1] == "sensitive" then
3147     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
3148       sensitive = true
3149     else
3150       if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
3151     end
3152   end
3153   if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
3154   if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
3155   if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end

```

```

3156     if x[1] == "tag" then
3157         style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
3158         style_tag = style_tag or [[\PitonStyle{Tag}]]
3159     end
3160 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

3161 local Number =
3162   K ( 'Number' ,
3163     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
3164       + digit ^ 0 * "." * digit ^ 1
3165       + digit ^ 1 )
3166     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
3167     + digit ^ 1
3168   )
3169 local string_extra_letters = ""
3170 for _ , x in ipairs ( extra_letters ) do
3171   if not ( extra_others[x] ) then
3172     string_extra_letters = string_extra_letters .. x
3173   end
3174 end
3175 local letter = alpha + S ( string_extra_letters )
3176   + P "â" + "â" + "ç" + "é" + "è" + "ê" + "ë" + "î" + "ï"
3177   + "ô" + "û" + "ü" + "Â" + "Ã" + "Ç" + "É" + "È" + "Ê" + "Ë"
3178   + "ï" + "î" + "ô" + "û" + "Ü"
3179 local alphanum = letter + digit
3180 local identifier = letter * alphanum ^ 0
3181 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

3182 local split_clist =
3183   P { "E" ,
3184     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
3185     * ( P "{" ) ^ 1
3186     * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
3187     * ( P "}" ) ^ 1 * space ^ 0 ,
3188     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
3189   }

```

The following function will be used if the keywords are not case-sensitive.

```

3190 local function keyword_to_lpeg ( name )
3191 return
3192   Q ( Cmt (
3193     C ( identifier ) ,
3194     function(s,i,a) return string.upper(a) == string.upper(name) end
3195   )
3196   )
3197 end
3198 local Keyword = P ( false )
3199 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

3200 for _ , x in ipairs ( def_table )
3201 do if x[1] == "morekeywords"
3202   or x[1] == "otherkeywords"
3203   or x[1] == "moredirectives"
3204   or x[1] == "moretexcs"
3205 then
3206   local keywords = P ( false )
3207   local style = [[\PitonStyle{Keyword}]]
3208   if x[1] == "moredirectives" then style = [[\PitonStyle{Directive}]] end
3209   style = tex_option_arg : match ( x[2] ) or style
3210   local n = tonumber ( style )

```

```

3211     if n then
3212         if n > 1 then style = [[\PitonStyle{Keyword}] .. style .. "}" end
3213     end
3214
3215     for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
3216         if x[1] == "moretexcs" then
3217             keywords = Q ( [[:] .. word ) + keywords
3218         else
3219             if sensitive
3220                 then keywords = Q ( word ) + keywords
3221                 else keywords = keyword_to_lpeg ( word ) + keywords
3222             end
3223         end
3224     Keyword = Keyword +
3225         Lc ( "{" .. style .. "}" * keywords * Lc "}" )
3226 end

```

The documentation of `lstlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

3219
3220
3221
3222
3223
3224
3225
3226

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

3227     if x[1] == "keywordsprefix" then
3228         local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3229         PrefixKeyword = PrefixKeyword
3230         + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
3231     end
3232 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3233 local long_string = P ( false )
3234 local Long_string = P ( false )
3235 local LongString = P ( false )
3236 local central_pattern = P ( false )
3237 for _ , x in ipairs ( def_table ) do
3238     if x[1] == "morestring" then
3239         arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3240         arg2 = arg2 or [[\PitonStyle{String.Long}]]
3241         if arg1 ~= "s" then
3242             arg4 = arg3
3243         end
3244         central_pattern = 1 - S ( " \r" .. arg4 )
3245         if arg1 : match "b" then
3246             central_pattern = P ( [[:] .. arg3 ) + central_pattern
3247         end

```

In fact, the specifier d is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

3248     if arg1 : match "d" or arg1 == "m" then
3249         central_pattern = P ( arg3 .. arg3 ) + central_pattern
3250     end
3251     if arg1 == "m"
3252         then prefix = B ( 1 - letter - ")" - "]" )
3253         else prefix = P ( true )
3254     end

```

First, a pattern *without captures* (needed to compute braces).

```
3255     long_string = long_string +
3256         prefix
3257         * arg3
3258         * ( space + central_pattern ) ^ 0
3259         * arg4
```

Now a pattern *with captures*.

```
3260     local pattern =
3261         prefix
3262         * Q ( arg3 )
3263         * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3264         * Q ( arg4 )
```

We will need Long_string in the nested comments.

```
3265     Long_string = Long_string + pattern
3266     LongString = LongString +
3267         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3268         * pattern
3269         * Ct ( Cc "Close" )
3270     end
3271 end
```

The argument of Compute_braces must be a pattern *which does no catching* corresponding to the strings of the language.

```
3272     local braces = Compute_braces ( long_string )
3273     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3274
3275     DetectedCommands = Compute_DetectedCommands ( lang , braces )
3276
3277     LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )
```

Now, we deal with the comments and the delims.

```
3278     local CommentDelim = P ( false )
3279
3280     for _ , x in ipairs ( def_table ) do
3281         if x[1] == "morecomment" then
3282             local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3283             arg2 = arg2 or {[PitonStyle{Comment}]}
```

If the letter i is present in the first argument (eg: morecomment = [si]{(*){*}}}, then the corresponding comments are discarded.

```
3284         if arg1 : match "i" then arg2 = {[PitonStyle{Discard}]} end
3285         if arg1 : match "l" then
3286             local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3287                 : match ( other_args )
3288             if arg3 == {[#\]} then arg3 = "#" end -- mandatory
3289             CommentDelim = CommentDelim +
3290                 Ct ( Cc "Open"
3291                     * Cc ( "{" .. arg2 .. "}" * Cc "}" )
3292                     * Q ( arg3 )
3293                     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3294                     * Ct ( Cc "Close" )
3295                     * ( EOL + -1 )
3296             else
3297                 local arg3 , arg4 =
3298                     ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3299                 if arg1 : match "s" then
3300                     CommentDelim = CommentDelim +
3301                         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" )
3302                         * Q ( arg3 )
3303                         *
3304                             CommentMath
3305                             + Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
```

```

3306      + EOL
3307      ) ^ 0
3308      * Q ( arg4 )
3309      * Ct ( Cc "Close" )
3310  end
3311  if arg1 : match "n" then
3312    CommentDelim = CommentDelim +
3313    Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3314    * P { "A" ,
3315      A = Q ( arg3 )
3316      * ( V "A"
3317        + Q ( ( 1 - P ( arg3 ) - P ( arg4 )
3318          - S "\r\$\" ) ^ 1 ) -- $
3319        + long_string
3320        + "$" -- $
3321        * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) -- $
3322        * "$" -- $
3323        + EOL
3324        ) ^ 0
3325      * Q ( arg4 )
3326    }
3327    * Ct ( Cc "Close" )
3328  end
3329 end
3330 end

```

For the keys `moredelim`, we have to add another argument in first position, equal to `*` or `**`.

```

3331  if x[1] == "moredelim" then
3332    local arg1 , arg2 , arg3 , arg4 , arg5
3333    = args_for_moredelims : match ( x[2] )
3334    local MyFun = Q
3335    if arg1 == "*" or arg1 == "**" then
3336      MyFun = function ( x ) return K ( 'ParseAgain.noCR' , x ) end
3337    end
3338    local left_delim
3339    if arg2 : match "i" then
3340      left_delim = P ( arg4 )
3341    else
3342      left_delim = Q ( arg4 )
3343    end
3344    if arg2 : match "l" then
3345      CommentDelim = CommentDelim +
3346      Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3347      * left_delim
3348      * ( MyFun ( ( 1 - P "\r" ) ^ 1 ) ) ^ 0
3349      * Ct ( Cc "Close" )
3350      * ( EOL + -1 )
3351    end
3352    if arg2 : match "s" then
3353      local right_delim
3354      if arg2 : match "i" then
3355        right_delim = P ( arg5 )
3356      else
3357        right_delim = Q ( arg5 )
3358      end
3359      CommentDelim = CommentDelim +
3360      Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3361      * left_delim
3362      * ( MyFun ( ( 1 - P ( arg5 ) - "\r" ) ^ 1 ) + EOL ) ^ 0
3363      * right_delim
3364      * Ct ( Cc "Close" )
3365    end
3366  end
3367 end

```

```

3368
3369 local Delim = Q ( S "{{()}}" )
3370 local Punct = Q ( S "=,:;!\\'\"")
3371
3372 local Main =
3373     space ^ 0 * EOL
3374     + Space
3375     + Tab
3376     + Escape + EscapeMath
3377     + CommentLaTeX
3378     + Beamer
3379     + DetectedCommands
3379     + CommentDelim

```

We must put `LongString` before `Delim` because, in PostScript, the strings are delimited by parenthesis and those parenthesis would be caught by `Delim`.

```

3380     + LongString
3381     + Delim
3382     + PrefixedKeyword
3383     + Keyword * ( -1 + # ( 1 - alphanum ) )
3384     + Punct
3385     + K ( 'Identifier.Internal' , letter * alphanum ^ 0 )
3386     + Number
3387     + Word

```

The LPEG `LPEG1[lang]` is used to reformat small elements, for example the arguments of the “detected commands”.

Of course, here, we must not put `local!`

```
3388 LPEG1[lang] = Main ^ 0
```

The LPEG `LPEG2[lang]` is used to format general chunks of code.

```

3389 LPEG2[lang] =
3390 Ct (
3391     ( space ^ 0 * P "\r" ) ^ -1
3392     * BeamerBeginEnvironments
3393     * Lc [[\@_begin_line:]]
3394     * SpaceIndentation ^ 0
3395     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3396     * -1
3397     * Lc [[\@_end_line:]]
3398 )

```

If the key tag has been used. Of course, this feature is designed for the HTML.

```

3399 if left_tag then
3400     local Tag = Ct ( Cc "Open" * Cc ( "{" .. style_tag .. "}" ) * Cc "}" )
3401         * Q ( left_tag * other ^ 0 ) -- $

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 3.1 and 4.0

This version introduces an incompatibility: the syntax for the relative and absolute paths in `\PitonInputFile` and the key `path` has been changed to be conform to usual conventions. A temporary key `old-PitonInputFile`, available at load-time, has been added for backward compatibility.

New keys `font-command`, `splittable-on-empty-lines` and `env-used-by-split`.

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by `piton`.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.
New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It’s now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

2	Installation	2
3	Use of the package	2
3.1	Loading the package	2
3.2	Choice of the computer language	2
3.3	The tools provided to the user	2
3.4	The syntax of the command <code>\piton</code>	3
4	Customization	3
4.1	The keys of the command <code>\PitonOptions</code>	4
4.2	The styles	6
4.2.1	Notion of style	6
4.2.2	Global styles and local styles	7
4.2.3	The style <code>UserFunction</code>	8
4.3	Creation of new environments	8

5	Definition of new languages with the syntax of listings	9
6	Advanced features	10
6.1	Insertion of a file	10
6.1.1	The command \PitonInputFile	10
6.1.2	Insertion of a part of a file	11
6.2	Page breaks and line breaks	13
6.2.1	Line breaks	13
6.2.2	Page breaks	13
6.3	Splitting of a listing in sub-listings	14
6.4	Highlighting some identifiers	15
6.5	Mechanisms to escape to LaTeX	16
6.5.1	The “LaTeX comments”	16
6.5.2	The key “math-comments”	17
6.5.3	The key “detected-commands”	17
6.5.4	The mechanism “escape”	18
6.5.5	The mechanism “escape-math”	18
6.6	Behaviour in the class Beamer	19
6.6.1	{Piton} et \PitonInputFile are “overlay-aware”	19
6.6.2	Commands of Beamer allowed in {Piton} and \PitonInputFile	20
6.6.3	Environments of Beamer allowed in {Piton} and \PitonInputFile	20
6.7	Footnotes in the environments of piton	21
6.8	Tabulations	23
7	API for the developpers	23
8	Examples	23
8.1	Line numbering	23
8.2	Formatting of the LaTeX comments	24
8.3	An example of tuning of the styles	25
8.4	Use with pyluatex	25
9	The styles for the different computer languages	27
9.1	The language Python	27
9.2	The language OCaml	28
9.3	The language C (and C++)	29
9.4	The language SQL	30
9.5	The language “minimal”	31
9.6	The languages defined by \NewPitonLanguage	32
10	Implementation	33
10.1	Introduction	33
10.2	The L3 part of the implementation	34
10.2.1	Declaration of the package	34
10.2.2	Parameters and technical definitions	37
10.2.3	Treatment of a line of code	41
10.2.4	PitonOptions	45
10.2.5	The numbers of the lines	50
10.2.6	The command to write on the aux file	50
10.2.7	The main commands and environments for the final user	51
10.2.8	The styles	60
10.2.9	The initial styles	62
10.2.10	Highlighting some identifiers	63
10.2.11	Security	64
10.2.12	The error messages of the package	65
10.2.13	We load piton.lua	67
10.2.14	Detected commands	67
10.3	The Lua part of the implementation	68
10.3.1	Special functions dealing with LPEG	68

10.3.2 The language Python	75
10.3.3 The language Ocaml	82
10.3.4 The language C	89
10.3.5 The language SQL	92
10.3.6 The language “Minimal”	95
10.3.7 The function Parse	96
10.3.8 Two variants of the function Parse with integrated preprocessors	98
10.3.9 Preprocessors of the function Parse for gobble	98
10.3.10 To count the number of lines	101
10.3.11 To determine the empty lines of the listings	102
10.3.12 To create new languages with the syntax of listings	104
